

Bandroom for Mac

How to Launch & Test
Step-by-Step (Even Your Kid Could Do It)

■ BEFORE YOU START (Check These First)

1. You need a **Mac** (laptop or desktop)
2. Make sure you are connected to Wi-Fi
3. Open the app called **Terminal** (Finder → Applications → Utilities → Terminal)

Tip: Press **⌘**+Space, type "Terminal", press Enter

4. Install .NET 10 SDK if you haven't:
 - a) Open Safari, go to: <https://dotnet.microsoft.com/download/dotnet/10.0>
 - b) Click the **macOS ARM64** (M1/M2/M3/M4) or **macOS x64** (Intel) download
 - c) Open the downloaded .pkg file and click Next until done
 - d) Close and re-open Terminal
 - e) Type: `dotnet --version` → should print "10.0.something"

■ STEP 1 — Copy the Bandroom Folder to Your Mac

You have the entire folder on your PC at:

C:\Bandroom

Copy this **entire folder** to your Mac. Do ONE of these:

Option A (USB stick): Copy the folder onto a USB stick, plug it into your Mac, drag the folder to your Mac's Desktop.

Option B (Network share): Share the folder from Windows, connect to it from Finder → Go → Connect to Server.

Option C (Zip): Right-click the Bandroom folder → Send to → Compressed folder. Email it to yourself or use Dropbox/Google Drive.

Once it's on your Mac, put it in your **home folder** so the path is: ~/Bandroom (That means: Macintosh HD → Users → your-username → Bandroom)

■ STEP 2 — Build the App (Tell the Computer to Make It)

In Terminal, type these commands ONE AT A TIME, pressing Enter after each:

```
cd ~/Bandroom
```

```
dotnet build src/Bandroom.Mac/Bandroom.Mac.csproj
```

You will see a bunch of text scroll by. Look for these magic words at the end:

Build succeeded.

If you see "Build FAILED" instead — see Troubleshooting at the end.

■ STEP 3 — Launch It!

In Terminal, type:

```
dotnet run --project src/Bandroom.Mac/Bandroom.Mac.csproj
```

Two things happen:

- A small gray window opens with "Bandroom" text
- Your web browser opens automatically to <http://localhost:18765>

That's it! You're looking at Bandroom! ■

■ STEP 4 — What to Click & Test

Now that it's running, try these things:

1. Pick a team: Click the team logo in the top-left corner. Search for "Alabama" or "Georgia". Click it. The whole app changes color to that team!

2. Browse the Event Board: Look at the left panel. Click "Downs", "Scoring", "Turnovers" tabs. Each one shows events you can assign songs to.

3. Check the Marketplace: Click "Marketplace" in the top bar. You should see song/background cards in a grid. Try clicking "Preview" on one.

4. My Downloads: Click the "My Downloads" tab in Marketplace. Shows what you've already downloaded.

5. Profile: Click the person icon top-right. You can sign in with Google, set your favorite team, etc.

6. UI Bot Check: Press F12 (or ■+Option+I) to open Developer Tools → Console tab. Look for colored lines with ■ and ■ — that's the automatic bug scanner reporting!

7. Play a sound: Click "Effects Test" (bottom-left gear icon). It plays the touchdown sound!

■ TROUBLESHOOTING (If Something Goes Wrong)

■ "dotnet: command not found"

→ .NET 10 SDK is not installed. Go back to Step 0 part 4.

■ "Build FAILED"

→ Copy the error message and ask Claude/ChatGPT what's wrong.

→ Common fix: make sure the WHOLE Bandroom folder was copied, not just some files.

■ Browser doesn't open / "Unable to connect"

→ In your browser address bar, manually type:

`http://localhost:18765/index.html`

→ If that doesn't work: close Terminal, open a new Terminal, repeat Steps 2-3.

■ Window says "wwwroot not found"

→ The Bandroom folder may not be complete. Make sure the wwwroot subfolder exists inside ~/Bandroom.

→ Check by typing in Terminal: `ls ~/Bandroom/wwwroot` (should show index.html, app.js, style.css, ui-bot.js)

■ No sounds play when clicking Effects Test

→ Make sure the Songs/Default folder exists and has .mp3 files in it.

→ Check: `ls ~/Bandroom/Songs/Default` (should show many .mp3 files)

■ "Permission denied" or "Screen Recording" popup

→ The game-watching feature (OCR) needs Screen Recording permission. You can skip this for testing — the app works fine without it. Go to System Preferences → Privacy → Screen Recording and allow Terminal if you want OCR.

■ QUICK REFERENCE CARD

What to type	What it does
cd ~/Bandroom	Go to the Bandroom folder
dotnet build src/Bandroom.Mac/Bandroom.Mac.csproj	Build (compile) the app
dotnet run --project src/Bandroom.Mac/Bandroom.Mac.csproj	Run the app
Ctrl+C (in Terminal)	Stop the running app
http://localhost:18765	Open app in browser manually
